Not all macOS Family 1 devices support raster order

groups. You query MTLDevice rasterOrderGroupsSupported at runtime to check.. ² On Apple family GPUs, memory barriers are supported only for compute command encoders.

Maximum vertex count for vertex amplification	Not available	2	2	Not available	Not available	Not available	Not availab				

³ Inline constant samplers, declared in Metal shading

language code, also count against this limit. For example, if the feature set limit is 16, you can have 12 API samplers and 4 language samplers (16 total) but you cannot have 12 API samplers and 6 language samplers (18 total).

⁴ Tile memory can be allocated between imageblocks and threadgroup memory, but the sum of these allocations cannot exceed the maximum total tile memory limit. Some feature sets cannot access tile memory directly, but they can access threadgroup memory.

⁵ A vector counts as n scalars, where n is the number of components in the vector. In iOS and tvOS feature sets, you can only reach the maximum number of inputs if you do not exceed the maximum number of input components. For example, you can have 60 float inputs (60 input components) but you cannot have 60 float4 inputs (240 input components).

⁶ There is a single limit for the combined number of buffers and textures.

⁷ Mac GPU families with tier 1 argument buffers support 64 buffers, 128 textures, and 16 samplers. Mac GPU families with tier 2 argument buffers support 500000 buffers and textures, and 1024 unique samplers.

Pixel Format Capabilities

This table lists the capabilities of all Metal pixel formats. These capabilities determine the operations that can be performed on a texture that uses a given pixel format. All graphics and compute functions can read or sample from any texture, regardless of its pixel format. Additional capabilities are defined as follows:

- Filter—the texture can be filtered during sampling.
- Write—the texture can be written to by a function.⁸
- Color—the texture can be used as a color render target.
- Blend—the texture can be blended.
- MSAA—the texture can be used as the destination for multisample antialias (MSAA) data.
- Resolve—the texture can be used as the destination for resolved MSAA data.
- All—the texture has all the previously-listed capabilities.

⁸ Read-write textures are available in some feature sets, where the texture can be both read from and written to by the same function. Query the readWriteTextureSupport

property of MTLDevice to determine support.

⁹ For PVRTC pixel formats, the clamp_to_zero sampler state is supported only in the iOS GPU Family 3 and 4 feature

sets. ¹⁰ Support for this pixel format varies by device. Query the depth24Stencil8PixelFormatSupported property of

MTLDevice to determine support.

¹¹ These texture formats cannot be used with sparse textures.

Texture Buffer Pixel Formats

This table lists pixel format restrictions when used with texture buffers. If a pixel format is not listed, it cannot be used with texture buffers. The capabilities are generally the same across all hardware families, with some specific GPUs having additional options.¹⁰

- Read—the texture buffer can be used with read access.
- Write—the texture buffer can be used with write access.
- Read/Write—the texture buffer can be used with read_write access.
- All—the texture has all the previously-listed capabilities.
